

Online Content

- Google Drive link: contains all the required Images and data for the website -> [Drive Folder](#)
- Canva file: contains information of all the current incubatees -> [canva file](#)

Files in this Zipped Folder

- Most of the folders names are self explanatory. These folders contain processed images from the above drive folder.
- There are two bash scripts which i used for processing these images with appropriate comments. These can be useful for further image processing.
- Events folder has appropriately named folders for each events upto feb 2024 and also contains a list of the same.
- You can find High Quality Logos in RISE logos folder

Github Repo

Old Website

- It is a backup version created by downloading old website page by page. Code can be found [here](#).

New Attempt

- Keeping in mind the need for ease of maintainnace and Need to avoid reuploading and editing data on every design, I decided to use a Database instead of wordpress.
- I used NocoDB (**a FOSS project**) as DB which has some parts publicly viewable, that can be fetched using API Calls to nocodb server (Currently free) [we can also spin up an local instance of the same on our server]
- Please excuse the lack of documentation for the newer atempt, but code is relatively simple. The code can be found [here](#)
